Unibamboo®

THE NEW FLOORING SENSATION

- Extraordinary, unique bamboo look.
- Ecological choice: Bamboo is not a tree but a very fast growing grass: within 5 years the stems are ready to harvest. After harvesting the mother plant continues to develop new shoots from the root system. This is very different from tropical hardwoods: they can take up to 100 years of aging after which the tree is felled and thus no longer contributes to the ecological system. Therefore bamboo is a rapidly renewable and very ecological raw material.

- Available in Tile and in Floor board shape. Both in compact dimensions, so easy to handle.
- The thin material (3 or 4mm) is easy to cut to size with simple tools.
- Because of the limited thickness, Unibamboo can often be placed easily on top of on existing floors (without having to remove that floor).
- Unibamboo is provided with a soft (latex) backing - offering excellent sound absorption and a very comfortable sensation to walk on.

Unibamboo combines the charm of parquet with the advantages of a PVC/Vinyl floor.
